

Full Stack Development Summary

Final keyword

The final keyword in java

The final keyword in java is a non-access modifier used to restrict changes to variables, methods, and classes.

Once some thing is declared as final, it cannot be modified, overridden, or inherited

Why do we use final keyword

Purpose

To make a variable constant

To make a method unchangeable

To make a class unextendible

INSTANCE OF KEYWORD

The instance of keyword in java is comparison operator used to test whether an object is an instance of a specific class or subclass.

It checks the relationship between an object and class.

Syntax

Object Name **instance of** class Name

- It returns a **Boolean value** (true or false)
- It is used for type checking – to verify an object's type **before casting**

THIS KEYWORD IN JAVA

What is this Keyword in Java?

this refers to the current object of the class. It is used when local variables and instance variables have the same name. Using this as an argument means: Passing the current object itself to a method or constructor. this can be used in both constructors and normal methods. It is not only for constructors.

Real-Life Analogy

Imagine a classroom where every student has a name tag. When a student says, "This is my book", the word “this” refers to that particular student.

Similarly, in Java

- this refers to the object that is currently being used.

Why do we use this keyword?

- A method needs access to the entire object, not just one variable
- We want to send the current object to another class or method
- We want object-to-object interaction
